
Release Notes SanerNow 4.2.2.0

June 14, 2019

SanerNow 4.2.2.0 provides more control over task scheduling, support for non-persistent desktop virtualization devices and minor bug fixes.

Task Scheduling

Extended the scheduler in PM Automation, EDR Detection and Response, EM Checks and Actions to have flexibility in scheduling patching and other tasks. Specifically, users can now choose selective months, weeks, days or any date to schedule tasks.

Non-Persistent Device Support

Support added for non-persistent desktop virtualized devices – agents are activated when such devices are initiated and are gracefully deactivated when shut down. This will ensure subscriptions are not locked down with an instance that is not running and are available for deploying on live systems.
